

I have observed some discrepancy in librika project as follows under admin pannel

Under suoer admin portal → user management , instead of icons I need visible instructioins in drop down menu

	ID	NAME	PHONE	ROLE	SCHOOL	CLASS	STATUS	ACTIONS
☐	#9999	Master Super Ad...	7000000000	SUPER_ADMIN	00000		ACTIVE	      
☐	#9998	Master Super Ad...	superadmin	SUPER_ADMIN	00000		ACTIVE	      

Under user management I want to capture various data , under each user , like its activity , profile details , which I can use for marketing etc..

Instead of codes give me text data , like name of school etc..

Mobile number validation is required , which should be 10 digits , so make changes at authentication while user registration

So when user register asl all the information about the user which could be helpful , like age , interests , gender , mail id , phone number , profile pic etc , which can be used to validate the user , also assign some toons icon which allow user to sleect his/her avatar , if he doen not want to add his her pic

This roles and permission part is not ok and not feasible

Here I want super admin can tweek among different permission it can allocate to different user profile , so create profile of different permsnsions or profiles , these permission or profiles can be allocate d to different roles and as per roles let system work according to those roles , and system should reflect the menus permission as per roles assigned .. every thing should work end to end , so first list out all manageable things then club them under roles and then create roles , and based on roles user should get reflection and permission

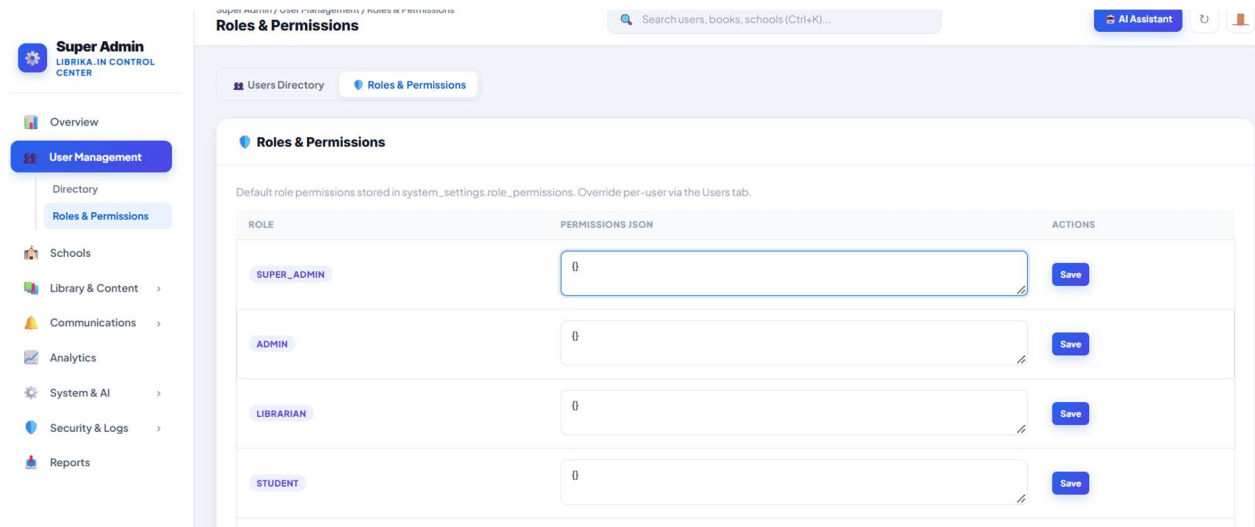

I want to implement Roles bases User management

admin it can also create new roles , as per requirement and assign the permission accordingly ,

Then under user management, super admin can change the role of user as per the roles list , all new roles should get reflected to assign roles

This can be done by via user profile , and under that we get options to change various settings like roles , other instructions like delete , edit save etc... enable disable features etc.

I also need bulk modification option , for example I want to assign some role to say all student , all teachers etc, then I can do that , or can be done via csv download and uplaod

Can u grep my learnings from Life oS architectuire and suggest the implementation plan for Life OS considering I have 2 portfolio 1 for school and another for general users , and another for administration
